

OP-FTIR Weekly Summary

10/26/16 6:00 – 11/02/16 6:00

The following information is for the time period from October 26th at 6:00am through November 2nd at 6:00am. This summary contains Vapor Monitoring and Detection System (VMDS) pilot-scale data collected over one week for the open path Fourier transform infrared spectrometer (OP-FTIR). Pilot-scale testing is focused on evaluating component integration and functionality. Data shown may include results from calibration and bump tests performed verify instruments function; these tests result in data spikes.

- Abbreviations:
- CH₄ = methane
 - NH₃ = ammonia
 - NO = nitric oxide
 - N₂O = nitrous oxide
 - NO₂ = nitrogen dioxide
 - OEL = occupational exposure limit
 - OP-FTIR = Open Path Fourier Transform Infrared Spectrometer
 - R² = R-squared
 - VMDS = Vapor Monitoring and Detection System

OP-FTIR Weekly Summary

10/26/16 6:00 – 11/02/16 6:00

Weekly Summary: The OP-FTIR spectrometer provides real-time multi-gas measurement (qualitative and quantitative) of gases¹. Even though the instrument is very accurate regarding the quantification of compounds, reported results cannot be directly calculated into a concentration for a specific location, this is due to its sample size – an open path between two points. The sample path is defined by the location of the emitter and the reflector which may be 10s to 100s of meters apart. Therefore data from these instrument types will not be directly compared to Occupational Exposure Limits (OELs) and Action Levels, but used to determine concentrations of compounds along the path of the instrument's beam.

Each analyte has a specific predetermined infrared (IR) trace which represents the model for that chemical. The detection and reporting of that chemical is based on evaluation of the R-squared (R^2) values (coefficient of determination) calculated by comparing the detection trace to the model trace for that chemical. R^2 is a statistical value representing the "percent of variance explained" by evaluating the detected trace with the model trace, or an estimate of how well the two traces match. R^2 values range from 0 to 1 with higher values indicating a better fit. R^2 values for OP-FTIR data are dependent on sample concentration, chemical compounds [chemicals present can interfere/overlap with each other at key locations; typically those having the same functional groups (e.g., methane or ketone groups)], and many other factors. Results presented here are for compounds having an R^2 value of greater than or equal to 0.5.

During the week in review, instrument 506A detected nitrous oxide (N_2O), methane (CH_4), 1-3 butadiene, and 1-butanol. A recurring pattern of simultaneous N_2O and CH_4 spikes was noted again this week. The 1-3 butadiene R^2 value is typically below the reporting threshold of 0.5, but in one instance the R^2 value was 0.5 or above and the detected peak concentration of 1-3 butadiene was 0.22 ppm. The 1-butanol R^2 value is also typically below the reporting threshold of 0.5, but in one instance the R^2 value was 0.5 or above and the detected peak concentration of 1-butanol was 3.1 ppm. The identification of 1-butanol is suspect and requires additional investigation because it occurred during a disturbance in the data over the weekend.

Instrument B also detected N_2O , CH_4 and methyl nitrite. Concentrations of N_2O and CH_4 are consistent with values reported by instrument A for the week. No strong correlation between the two instruments was observed this week. The methyl nitrite R^2 value is also typically below the reporting threshold of 0.5, but in one instance the R^2 value was 0.5 or above and the detected peak concentration of methyl nitrite was 0.10 ppm. The identification of methyl nitrite is suspect and requires additional investigation because it occurred during a disturbance (coincided with the drop of methane to zero) in the data over the weekend.

Most compounds detected by both instruments are typically present in air at detectable levels (including 1-3 butadiene²). This information indicates that the

OP-FTIR Weekly Summary

10/26/16 6:00 – 11/02/16 6:00

OP-FTIR units are effectively measuring composition of the gas components within its path. Specific instrument information is reported below.

October 26th – November 2nd 2016 Instrument Notes:

Table 1. Chemical Species Detected on Open Path FTIRs at AP Tank Farm.

| Chemical | 506A: OP-FTIR Multipath | 506B: OP-FTIR Single |
|-------------------------|--------------------------------|-----------------------------|
| Nitrous Oxide* | ND – 0.45 ppm | ND – 0.40 ppm |
| Ammonia* | ND | ND |
| Methane | ND - 2.6 ppm | ND – 1.9 ppm |
| 1-3-Butadiene* | ND - 0.22 ppm | ND |
| 1-Butanol* | ND – 3.1 ppm | ND |
| 2-Hexanone* | ND | ND |
| 3-Buten-2-one* | ND | ND |
| Acetaldehyde* | ND | ND |
| Acetonitrile* | ND | ND |
| Benzene* | ND | ND |
| Butanal* | ND | ND |
| Butyl Nitrite* | ND | ND |
| Ethylamine* | ND | ND |
| Formaldehyde* | ND | ND |
| Furan* | ND | ND |
| Methanol* | ND | ND |
| Methyl Isocyanate* | ND | ND |
| Methyl Nitrite* | ND | ND – 0.10 ppm |
| N-Nitrosodiethylamine* | ND | ND |
| N-Nitrosodimethylamine* | ND | ND |
| N-Nitrosomorpholine* | ND | ND |
| Propanenitrile* | ND | ND |
| Pyridine* | ND | ND |
| Tributyle Phosphate* | ND | ND |

Notes: *Chemical is on COPC list

ND – Not detected by instrument (i.e., either value reported was 0 or R² value is <0.5)

OP-FTIR Weekly Summary
