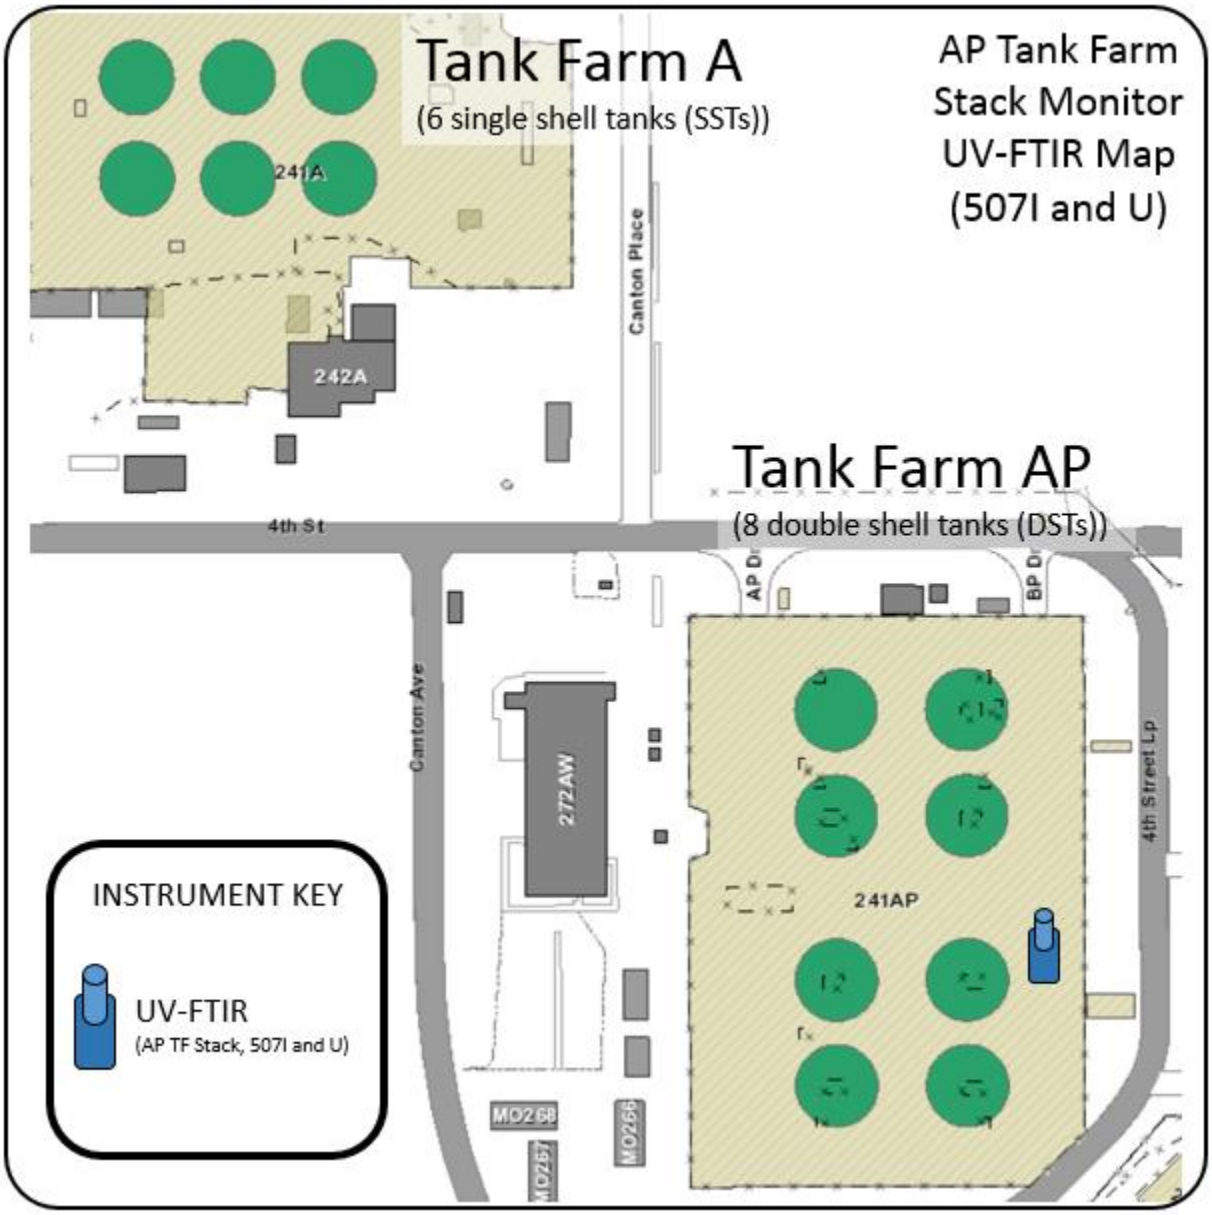
Vapor Monitoring Detection System Weekly Report – AP Tank Farm Stack Monitoring

Revision 0: Initial Release of Report

1/18/2017 6:00 – 1/25/2017 6:00

AP-Tank Farm Stack Monitor (north is up)



Vapor Monitoring Detection System Weekly Report

1/18/2017 6:00 – 1/25/2017 6:00

Abbreviations and Units

CH_4	=	methane
COPC	=	chemicals of potential concern
IDMS	=	Integrated Document Management System
FTIR	=	Fourier transform infrared spectrometer
IR	=	infrared
ND	=	not detected
NH_3	=	ammonia
NO	=	nitric oxide
N_2O	=	nitrous oxide
OEL	=	occupational exposure limit
OSHA	=	Occupational Safety and Health Administration
PEL	=	permissible exposure limit
ppb	=	parts per billion
ppm	=	parts per million
UV	=	ultraviolet
UV-DOAS	=	ultraviolet differential optical absorption spectrometer
UV-FTIR	=	ultraviolet - Fourier transform infrared (representing both analytical elements of the instrument, the UV and IR modules)
VMDS	=	vapor monitoring detection system

VMDS Instruments

507	=	ultraviolet - Fourier transform infrared (UV-FTIR) AP Farm Stack
507I	=	FTIR AP Farm Stack
507U	=	UV-DOAS AP Farm Stack

Vapor Monitoring Detection System Weekly Report

1/18/2017 6:00 – 1/25/2017 6:00

Introduction

This summary contains Vapor Monitoring and Detection System (VMDS) pilot-scale data collected over one week (1/18/2017 at 6:00 a.m. through 1/25/2017 at 6:00 a.m.) using the AP-Farm stack monitor[1]. This instrument is a dual channel FTIR/UV-DOAS spectrometer that provides real-time multi-gas measurement (qualitative and quantitative) of gases. The concentrations detected for the 507I (FTIR) and 507U (UV-DOAS) shall be reported separately. The implementation method for this instrument allows for very accurate identification and quantification of compounds found in the AP-Farm exhauster stack.

Chemical compounds found in the stack are not representative of what is found in the work environment, so their concentrations are not reviewed against Occupational Exposure Limits (OELs) or other limits implemented in work environments. This review focuses on chemicals present, patterns, and observations during waste disturbing activities.

Pilot-scale testing is focused on evaluating component integration and functionality. Data shown may include results for calibration and calibration check (bump test) performed to verify sensors are functioning; these tests are visible in the data as spikes. Raw spectra (data) may need to be reprocessed and reviewed as understanding of the particular instruments being used as part of the VMDS pilot test are deployed and the company's ability to align the instruments with the overall objectives of the pilot test improves.

For the stack monitor, each analyte has a specific reference spectrum, which represents the absorption characteristics for that chemical in the IR or UV spectral regions. Reference spectra for each analyte are stored in an instrument software library (library) that specifies which absorption features are analyzed, how analysis is performed, and reporting criteria. Revisions to the library are periodically performed to improve accuracy of analysis for analytes; the optimization of the library is iterative and periodic changes to the library are being performed. Revisions to the library may result in the identification of a compound not previously thought to be present, or conversely determine that a previously reported analyte was not actually present. Identification of an analyte depends on the analytical method (UV or IR), the library used, analyte concentration, other chemical compounds present, and other factors. The compounds present can interfere/overlap with the analyte spectral signature, especially for compounds having the same functional groups (e.g., methyl or ketone groups). Work is ongoing to optimize the library and minimize these interferences.

Vapor Monitoring Detection System Weekly Report

1/18/2017 6:00 – 1/25/2017 6:00

1/18/2017 through 1/25/2017 Summary

The 507I (FTIR) instrument went offline and stopped reporting to OSI Pi due to failure of the IR module at 12:20, 1/24/2017, remaining offline through the reporting period. Waste retrieval activities, consisting of activation of the supernate and slurry pumps required to retrieve waste from AY-102 to AP-102, were performed at 22:11 on 1/24/2017 and concluded at approximately 03:11 on 1/25/2017.

Review of the data collected while sampling the actively ventilating stack shows that ammonia concentrations ranged from 35 to 62 ppm (507I and 507U), nitrous oxide concentrations ranged from 2.5 to 3.8 ppm (507I), mercury concentration ranged from 0.000038 to 0.00026 ppm (507U) and m-xylene concentrations ranged from non-detect to 0.089 ppm (507U) (Table 1). Reported concentrations for ammonia from both the 507I and 507U (UV-DOAS) instruments were within the observed range typical for the AP Tank Farm Stack, and no changes were observed when waste disturbing activities occur (Figures 1 and 2). Figures 1 and 3 indicate that waste retrieval pumping activities occurred after failure of the 507I IR module, when no data were reported. The concentrations reported for nitrous oxide are consistent with those observed when no waste disturbing activities occur (Figure 3). The 507U instrument reported a spike of mercury concentration corresponding with what is typically seen with the initiation of waste retrieval pumping activities (Figure 4). Figure 5 shows individual observances of m-xylene from 507U during the reporting period; concentrations are in line with what can be seen in urban areas[2]. The 507I instrument monitored for 90% and the 507U instrument monitored for >99% of the reporting period (Table 2).

The collection of 507U data for this reporting week preceded library changes performed on 3/8/2017, so data were reprocessed to determine if compounds were correctly detected by the instrument. The reprocessed data with the optimized library eliminates false-positive readings of compounds that showed as detections and reported in OSI PI[3]. The data were reprocessed and the output data can be obtained from Integrated Document Management System (IDMS).

Vapor Monitoring Detection System Weekly Report

1/18/2017 6:00 – 1/25/2017 6:00

Table 1. Chemical Species Detected[a] in the AP Tank Farm Stack by Method

Chemical	507I FTIR (ppm)	Chemical	507U[b] UV-DOAS (ppm)
Ammonia*	38 – 62	Ammonia*	35 - 60
Nitrous Oxide*	2.5 – 3.8	Nitric Oxide	ND
Methane	ND	1,3-Butadiene*	ND
1,3-Butadiene*	ND	2-Methyl-2-butenal*	ND
1-Butanol*	ND	2-Methylfuran*	ND
2-Hexanone*	ND	Acetaldehyde*	ND
3-Buten-2-one*	ND	Benzene*	ND
Acetaldehyde*	ND	Butanal*	ND
Acetonitrile*	ND	Ethylamine*	ND
Benzene*	ND	Formaldehyde*	ND
Butanal*	ND	Furan*	ND
Butyl Nitrite*	ND	Mercury*	0.000038 – 0.00026
Ethylamine*	ND	Methyl Nitrite*	ND
Formaldehyde*	ND	Pyridine*	ND
Furan*	ND	1,2,4 Trimethylbenzene	ND
Methanol*	ND	1,3,5 Trimethylbenzene	ND
Methyl Isocyanate*	ND	Ethylbenzene	ND
Methyl Nitrite*	ND	m-Xylene	ND – 0.089
N-Nitrosodiethylamine*	ND	Nitrogen Dioxide	ND
N-Nitrosodimethylamine*	ND	o-Xylene	ND
N-Nitrosomorpholine*	ND	p-Xylene	ND
Propanenitrile*	ND	Styrene	ND
Pyridine*	ND	Sulfur dioxide	ND
Tributyl Phosphate*	ND	Toluene	ND

Notes: a) Based on data retrieved from OSI PI; OSI PI System is a data visualization software package from OSIsoft.
b) Chemical concentration data was reprocessed to eliminate false-positive data
* Chemical is on COPC list
ND – Not detected
